Interview Practical Report Analyst

Author: Tom Aylen

Version:

Release Date: 02/08/2021 Status: Release

Better for business

Contents

3.1	Provide Files to locane	11
3	Completion	11
2.3.1	Find and Fix Fault	10
2.3	VB Practical	9
2.2.5	Create Column Chart	8
2.2.4	Create Dataset and Table	7
2.2.3	Add Date Parameters	6
2.2.2	Add Row Group	6
2.2.1	Add Total Column	5
2.2	SSRS Practical	4
2.1	Install Northwind Database	4
2	Instructions	4
1.2	Supplied Files	4
1.1	Software	3
1	Requirements	3

1 Requirements

1.1 Software

The following software is required for completing the following practical interview.

Visual Studio Community

https://visualstudio.microsoft.com/downloads/

SQL Server Data Tools (SSDT) for Visual Studio

https://docs.microsoft.com/en-us/sql/ssdt/download-sql-server-data-tools-ssdt?view=sql-server-ver15

Microsoft Reporting Services Projects Extension for Visual Studio

Installed from Visual Studio menu: Extensions > search for name

https://marketplace.visualstudio.com/items?itemName=ProBITools.MicrosoftReportProjectsforVisualStudio

SQL Server Express

The Visual Studio Project is configured to use the default server name of './SQLEXPRESS'. Using the same name will avoid having to change it in the project.

https://www.microsoft.com/en-us/sql-server/sql-server-downloads

SQL Server Management Studio

https://docs.microsoft.com/en-us/sql/ssms/download-sql-server-management-studio-ssms?view=sql-server-ver15

1.2 Supplied Files

The following listed files are supplied, these can be downloaded via GitHub at the below link.

The files constitute a Visual Studio Solution which contains 2 Projects.

https://github.com/locaneDevApps/report-analyst-practical

File Type	Name
Solution File	locane Report Analysis Practical.sln
Visual Studio Project Folder This is a SSRS Report Project	SSRS Practical
Project File	SSRS Practical.rptproj
SSRS Report	Activity1.rdl
Visual Studio Project Folder This is a .NET Core Console App	VB Practical
Folder	bin
Folder	obj
Visual Basic Source Code	Activity2.vb

2 Instructions

After downloading and installing the required software, the Northwind database will need to be installed to the local SQL Instance.

2.1 Install Northwind Database

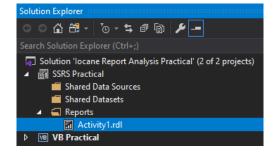

Open SSMS (SQL Server Management Studio), connect to the local SQL instance on your machine, open a new query. Within the query copy the code from the script instnwnd.sql and run it.

https://github.com/Microsoft/sql-server-samples/tree/master/samples/databases/northwind-pubs

2.2 SSRS Practical

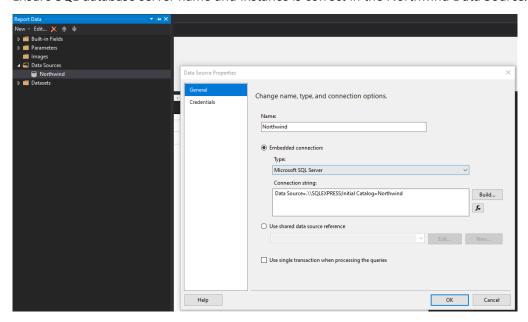

The SSRS (SQL Server Reporting Services) portion of the test will use the Northwind database. Ensure the server name is correct. If the default SQL Express instance is not used it will need to be updated.

Open the solution file in Visual Studio. Open the SSRS Project, and the Activity1.rdl file.

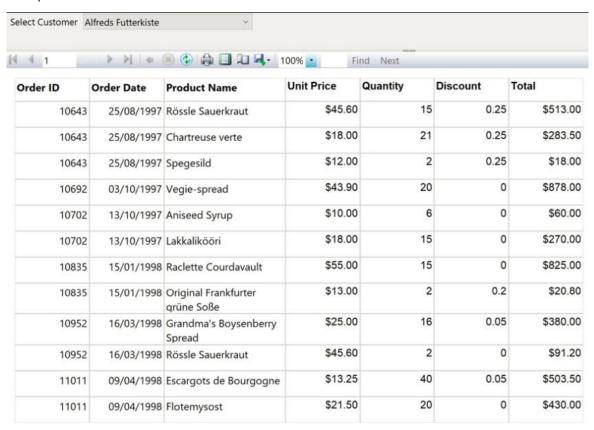

Ensure SQL database server name and instance is correct in the Northwind Data Source.

2.2.1 Add Total Column

The Activity1.rdl file has a Dataset and table already created. Add a 'Total' column to the table. Total is the cost of each product in the order including the discount.

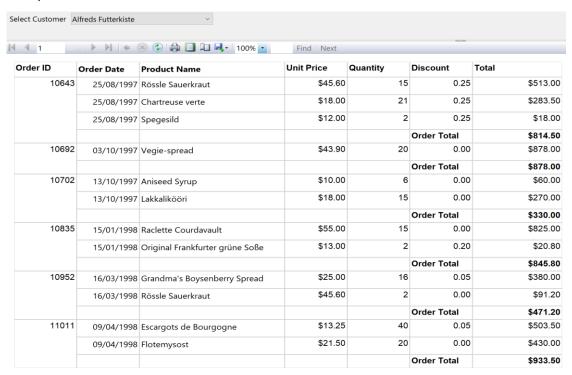

2.2.2 Add Row Group

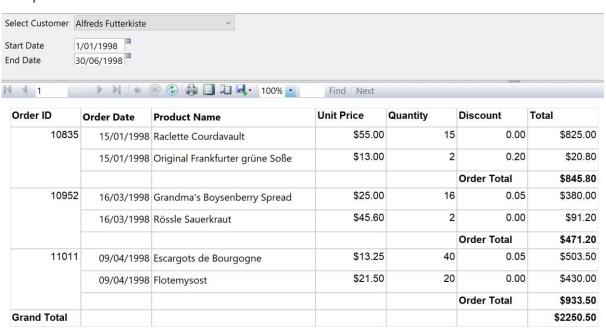

Create a new Row Group and an 'Order Total' that sums the 'Total' values for each Order.

Example

2.2.3 Add Date Parameters

Add two new parameters that are used to filter the Orders by the Order Date. Orders should appear that have an Order Date between the new Start Date parameter and the new End Date parameter.

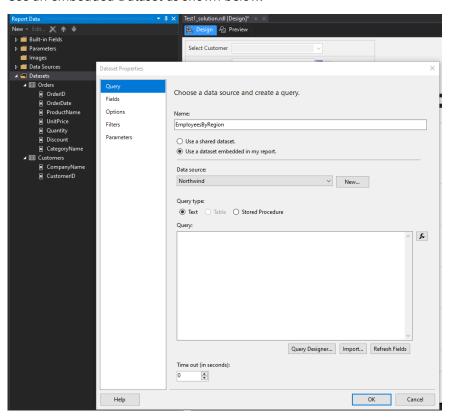

2.2.4 Create Dataset and Table

Create a new Dataset to find the number of Territories in each Region, as well as the number of unique employees that work in each region.

Use an embedded Dataset as shown below.

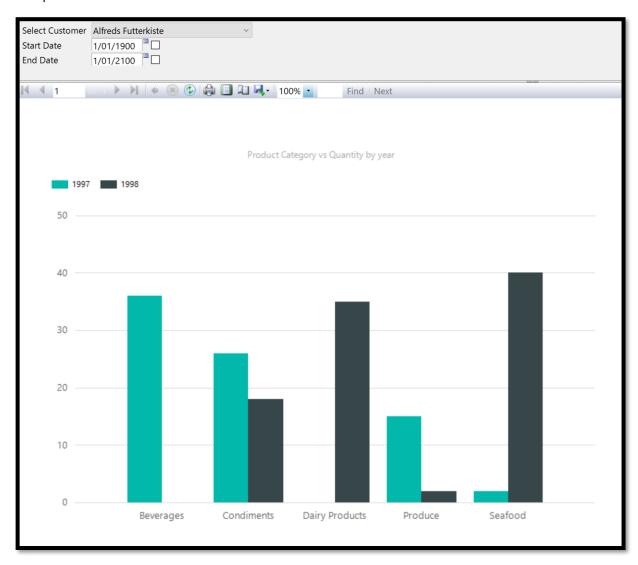

Region ID	Region Description	count territories	count employee
	1 Eastern	19	4
	2 Western	15	2
	3 Northern	11	2
	4 Southern	4	1

2.2.5 Create Column Chart

Create a column chart showing the total quantity of products ordered by category and then group by the year of the Order Date.

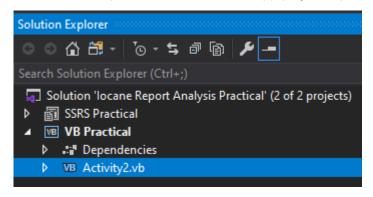

To get the category data you can either modify the existing 'Orders' Dataset or create a new one.

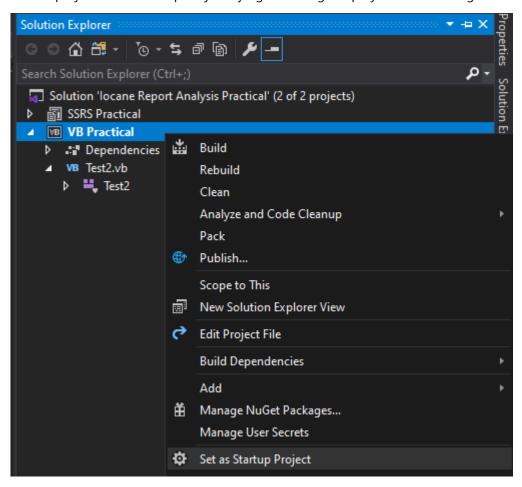

2.3 VB Practical

The Visual Basic practical uses a Console App project. Open the VB Source file Activity2.vb

Set the project as the Startup Project by right-clicking the project and selecting 'Set as Startup Project'

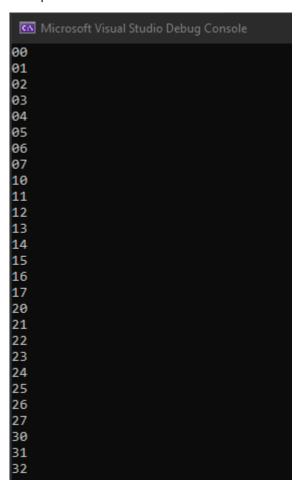

This allows the app to be tested by clicking the VB Practical button.

2.3.1 Find and Fix Fault

There is code in Activity2.vb that should print out a sequence of number in octal (base 8). The code currently prints does not do this, it prints another sequence. Find and fix the problem.

3 Completion

3.1 Provide Files to locane

Upon completion, please email the Solution folder in a single zipped file to DevApps@iocane.com.au.

The files and folders shown below should be included in the zip file.

Name	Date modified	Туре
SSRS Practical	4/08/2021 12:52 PM	File folder
☐ VB Practical	4/08/2021 12:49 PM	File folder
🔑 locane Report Analysis Practical.sIn	4/08/2021 12:32 PM	Microsoft Visual Studio Solution
